Testimonial

A few years ago when I was building a kitchen extension, I had researched the possibility of using solar energy in the form of photovoltaic tiles. My intention when considering the design of the building had been to make it as green as possible. I received a very negative response from the planning department at my local council and was so put off I didn't pursue the idea.

But I hadn't put the idea out of my mind and decided to do some research. In a fairly arbitrary way I found Affordable Solar Energy on the internet. I contacted the company and made an appointment and a marketing consultant came to see me. He spent about 3 hours giving me an in-depth explanation of how the systems work (I had decided to go for hot water and photovoltaic systems) how the grants work, what sort of savings I would make and the investment aspect of the electric solar system and details of the survey and the installation process. I was happy to answer the questions regarding my social network and the services in this area as I believe the company relies entirely on word of mouth for marketing and advertising. Government policy has certainly changed in the last 5 years and using solar energy is now being encouraged by grants and rebates.

I now find myself to be almost evangelical in my enthusiasm for solar energy and will extol its virtues at the drop of a hat! I will be passing your referral cards on to several of my friends as I feel confident that they will be equally impressed by your highly professional organisation. And once I know how much I'm saving each year on fuel bills I will be unstoppable in talking about solar energy.
