

We had been interested in the concept of solar power for some time but could not see the financial viability of systems that just provide hot water. We were therefore rather sceptical when we met Affordable's Marketing Consultant, and told him as much at the outset. He said this was something totally different and went on to explain in detail about the Photo Voltaic system and the new Feed in Tariffs that had recently been brought in by the Government. That made it more appealing to us and the more we went into it the more it seemed to make sense. This would be a big financial investment for us, but there appears to be every chance of getting a return of around 6% which at the present time is extremely good. The Consultant was very helpful and patient in dealing with our concerns and we ended up putting in an order.

The installation was done in a very efficient manner and with a minimum of disruption by the roofer and the electricians. The panels seem to be working fine and although sunshine has been in short supply since we had ~~the~~ them installed we have still managed to generate 50 units in the first week. We are in the process of getting our installation registered with our energy supplier and looking forward to receiving our first cheque from them!
